Product Information

MS PhosphoMix 2 Light

Catalog Number **MSP2L** Storage Temperature –20 °C

Product Description

Within mammalian systems, cellular processes have been shown to be largely reliant upon signaling via post-translational modifications (PTMs) such as protein phosphorylation and dephosphorylation. The complete elucidation of these signaling pathways will therefore require a full understanding of the roles of kinases, phosphatases, and most importantly, their substrates. However, several factors have hindered the analysis of protein phosphorylation. For example, in the analysis of phosphopeptides via mass spectrometry, ion suppression² phenomena can lead to a loss in signal and, therefore, to an underestimation of the role that phosphorylation plays in biological processes. Additionally, loss of phosphopeptides during handling has been noted, which has been attributed to adsorption of the species onto metal surfaces, leading to a diminished signal for phosphorylated molecules.

Newly developed methods to aid in the analyses of phosphorylated species, including the capture and enrichment of phosphopeptides and phosphoproteins, have been moderately successful in allowing deeper analyses of the phosphoproteome. However, these techniques are prone to bias, leading to selective enrichment of certain phosphorylated species over others. For example, immobilized affinity chromatography (IMAC) has been noted for its tendency to enrich selectively multiple phosphorylated species compared to single phosphorylated species.⁴

The PhosphoMix line of products has been designed to allow for the testing of the strengths and weaknesses of phosphopeptide sample processing, analysis protocols, and instrumental configurations. The mixes are produced from synthetic phosphopeptides with sequences derived from naturally occurring peptides identified in HeLa cells.⁵ Because the sequences are derived from mammalian cells, many natural phosphorylation motifs, such as those presenting an abundance of proline, are represented.⁶ Additionally, the phosphopeptide distribution in each mix has been chosen to present a broad range of characteristics, including ionizability, LC retention time, charge state, and isoelectric point.

PhosphoMix 1, 2, and 3 were designed in a complementary fashion, as highlighted in Table 1. For example, all three mixes contain peptides of the same sequence with different sites of phosphorylation. Production of the phosphopeptides within these mixes is accomplished using standard solid phase protocols after which, the phosphopeptides are purified via HPLC and quantified with amino acid analysis (AAA). Although AAA is considered to be one of the most accurate methods for protein and peptide quantitation, the inherent complexities in the process can lead to discrepancies of 10–20% in quantitative values.⁷

Each of the three phosphopeptides mixes is available in a naturally occurring isotopic abundances (light) or as a stable isotope enriched version (heavy), making the set of products highly amenable to quantitative analyses, to allow users to compare recovery between workflows or techniques. However, as previously detailed, slight differences in AAA measurements can lead to discrepancies in actual concentration values. Therefore, if this product is intended to be used in a quantitative manner, it is strongly recommended normalization of the light and heavy samples be performed as a control. This can most easily be accomplished by mixing a portion the light and heavy mixtures in a 1:1 fashion prior to any sample manipulation and experimentally determining the actual heavy to light ratio.

Component

MS PhosphoMix 2 Light, 20 pmoles each of 10 phosphopeptides (200 pmoles total) dried in a 0.5 mL vial. 1 vial

Precautions and Disclaimer

This product is for R&D use only, not for drug, household, or other uses. Please consult the Safety Data Sheet for information regarding hazards and safe handling practices.

Preparation Instructions

The preparation should be compatible with the analysis to be run. For LC/MS analysis, it is suggested the peptides be suspended in acidic aqueous solution (e.g., 0.1% formic acid) containing 20% acetonitrile, and vortexed well to ensure complete dissolution. *Vortexing of the solution upon standing is also recommended.*

Storage/Stability

The vial ships in wet ice and storage at -20 °C is recommended.
